

This programming calculator will take four (4) inputs:

1. A year.
2. The number of acres burned by forest fires in that year.
3. A second year.
4. The number of acres burned by forest fires in that year.

And will output and

1. Calculate the increase/decrease in acres burned between the first and second years.
2. Calculate the carbon dioxide emissions for the first and second years.
3. Print the results of those calculations on the console.
